

— PROPOSAL · PREPARED FOR DICK'S PAWN SUPERSTORE

Where AI actually **pays for itself** in a pawn superstore.

The opportunity, the plan, and exactly how it plugs into the Shopify store you already run — same checkout, same apps, same admin, nothing replaced.

Kyle Fries

Marketing & AI Systems

Myrtle Beach, SC

Local, on-site when needed

July 2026

Valid 60 days

This deck contains no invented numbers. Every figure about your business was pulled from your live catalogue and public listings, and every projection on the calculator slide uses inputs you control.

I didn't bring a portfolio. I brought your website.

🏆 The Grand Strand's #1 Pawn Superstore

Why pay retail? Shop thousands of deals — or turn your stuff into **same-day cash.**

Family-owned since 1987 with five locations across the Myrtle Beach area. Jewelry, electronics, instruments, tools, sneakers & more — new items hit the floor every single day.

What your catalogue actually says about your floor

Pulled directly from your live product feed on 26 July 2026 — 1,565 items, 1,527 of them in stock.

You are a jewelry business with a superstore attached

65% of everything listed online is jewelry and gold. That is a strength — it's high-margin and it's what your jewelers are for — but online it means most visitors are handed 991 rings and asked to browse.

Two things I noticed in the data

Stock arrives in batches. The newest 8 items were all listed the same day. Between batches, other departments go quiet online even when product is on the floor.

Your tagging is good but private. Codes like *GR*, *AP*, *HW* are consistent enough to automate against — that's a real asset most shops don't have.

— MEASURED, NOT GUESSED

What's costing you today

I measured your live site against the rebuild on 26 July 2026. You can re-run every one of these.

	DICKSPAWN.COM TODAY	THE REBUILD	WHY IT MATTERS
Homepage weight	94.7 KB transferred 863 KB of HTML, 77 scripts	7.7 KB	Most of your traffic is on a phone, often on beach-town cell service.
Time to first byte	0.42 s	0.15 s	Speed is a ranking factor and a bounce factor.
Business markup on homepage	None	All 5 stores	Hours, addresses, phone and rating handed to Google directly.
Per-city landing pages	None (404)	5 pages	You compete in five separate local markets with one page.
Link previews when shared	Square logo	Designed card	Every text, post and email that shares your link.
Product page markup	Already correct ✓	Matched	Credit where it's due — Shopify does this part well.

Transfer sizes measured compressed, cache-busted, from the same connection. "Business markup" = LocalBusiness/PawnShop structured data; your homepage returned zero structured-data blocks.

The new site becomes your store's theme

You already own the hard part — Shopify runs your checkout, inventory and apps, and your product pages are already correct for Google. The redesign installs as a new **theme** on that same store. No migration, nothing rebuilt.

1

Install quietly

The new design is added as an *unpublished* theme. Customers see nothing.

2

You preview privately

A private link shows your real store — live products, live prices — in the new design.

3

One click to launch

When you approve, publishing is a single click. No downtime, no data moves.

4

One click back

Your current theme stays saved. If you ever want it back, that's one click too.

Checkout untouched

Payments, cart, shipping, taxes — all Shopify's engine, none of it changes.

Apps keep working

Call-for-Price, your SMS marketing tool, the eBay flow — they plug into the engine, not the design.

Same admin for staff

Your team adds and edits products exactly where they do today. Nothing new to learn.

Considered and rejected: replatforming (months of risk to rebuild what works), a separate second website (competes with your own store on Google), and a custom "headless" build (overkill without an engineering team). The theme route is the only zero-disruption option — and it's also the cheapest.

Sold in the store = gone from the site. Automatically. Always.

Your inventory is one-of-a-kind — quantity one of everything. The worst failure a pawn shop's website can have is selling a ring in Conway that's still listed online.

WITH A SEPARATE WEBSITE

A sync you have to babysit

- ✗ Every sale must be copied to the site — by hand or by a feed that can break
- ✗ A missed delisting means selling the same ring twice
- ✗ An angry refund, a bad review, staff time cleaning it up

WITH THE THEME APPROACH

Nothing to sync — the site is the store

- ✓ The website reads live inventory directly from Shopify
- ✓ Mark it sold at the counter → it's off the site that second
- ✓ No feed, no babysitting, no way for it to drift

This isn't a feature we build — it's a problem the architecture makes impossible. That's the best kind of fix.

In a pawn business, AI is a speed upgrade — not a cleverness upgrade

Your team already knows what things are worth. That judgement is the business, and it isn't for sale. What AI removes is the dead time around it — and every system follows one safe pattern, powered by Claude.

1

Something happens

A photo is taken, an item arrives, a review comes in.

2

AI does the typing

Claude writes the listing, applies the category, drafts the reply.

3

Saved as a draft

Invisible to customers. Sitting in your Shopify admin, waiting.

4

Your staff approve

Review, edit if needed, click Active — the same click they make today.

5

It goes live

On the site, correctly categorised, ready to sell.

Why drafts matter

Shopify has a built-in "draft product" state — invisible to customers until activated. The AI writes into **drafts only**. Nothing it produces reaches a customer without a human clicking approve. No new review tool to learn; the gate is the admin your team lives in.

What the AI never touches

Your pawn system — loans, tickets, customer identities, compliance — is never connected to the AI. Claude only ever sees **merchandise**: photos, titles, item numbers. And prices are *suggestions*; the number that goes live is always your appraiser's.

Photos in. Finished listing out.

The proof this is needed is in your own data: your product codes end in six different people's initials, in twelve different formats. That's your staff hand-typing every item into Shopify.

Staff snaps photos

A phone page: 1–4 photos, the item number, optionally a few words — "14k rope chain, 24 inch, 20 grams".

Claude writes everything

Title in your house style, full description, correct department and category, condition notes it can see in the photos, and a suggested price range.

Draft lands in Shopify

Photos attached, tags applied. Your appraiser sets the real price, clicks Active. Minutes of typing becomes seconds of reviewing.

≈ **5¢** AI cost per listing — included in the plan

2 weeks to prove it, timed on your real items

This is the \$1,500 pilot on the pricing slide: one department, before/after timing on 20 real items, written findings either way.

Your catalogue, finally organised like a superstore

The hidden problem

Your team tags products with internal shorthand — and it's consistent, which is genuinely rare. But it's private shorthand: while building the demo I found that reading one code naively files **Louis Vuitton handbags under "Tools & Hardware"**. Your own website search inherits confusions like that today.

1

Real category pages

"Gold Rings", "Power Tools", "Designer Bags" become true Shopify collections that update themselves as stock changes.

3

Every future item, automatic

New products get categorised the moment they're created — whether the Listing Assistant made them or a staff member typed them.

The fix

Claude reads all 1,565 products once — titles plus your existing codes — and writes clean, universal categories back into Shopify: department, type, brand, metal. Your staff's tags stay untouched; the new ones are added alongside.

2

Jewelry gets navigable

65% of your catalogue is jewelry. Shoppers filter rings / necklaces / bracelets / watches instead of scrolling 991 items.

One-time AI cost for the full catalogue: under \$10 — it runs as an overnight batch job. This is the least glamorous system in the plan and possibly the highest-value one.

Built on the same store, the same pattern

3

"You asked — it just came in"

Counter staff log what customers are hunting for. When a matching item lands in Shopify, Claude spots the match and drafts a text — sent through the **SMS app you already pay for**. A staff member approves the day's queue in one sitting.

HIGHEST-INTENT LIST **YOU OWN**

4

Ask-the-store, answered instantly

A website chat that answers "are you open," "do you buy tools," and — because it reads your live Shopify inventory — "do you have any PS5s?" Every real conversation still ends with your phone number; the widget just absorbs the calls that never needed a person.

PHONE RINGS FOR **REAL CALLS**

5

Every review, answered well

2,000+ Google reviews across five stores deserve replies. Claude drafts each one in your voice; a manager approves or edits before anything posts. Nothing reaches the public unread — same rule as everywhere else.

REPUTATION **MAINTAINED**

Notice what's *not* here: no new subscriptions, no new dashboards, no system your team has to learn. Everything lands in Shopify, your SMS app, or an approval queue.

How this plugs into the counter

UNCHANGED

The counter

Item taken in, ticket written, photographed. Exactly as today.

SYSTEM OF RECORD

Your pawn software

Holds the item number, loan and compliance data. We only ever read from it.

THE NEW BIT

Enrichment layer

Photos cleaned, title and description written, category and tags applied, price range suggested.

HUMAN GATE

Shopify drafts

Staff approve in the admin they already use. Nothing publishes unread.

OUTPUT

Every channel

Website, eBay, and anywhere else worth listing — from one approval.

A • Native API

Bravo — who now own PawnMaster — publish an API and already integrate with eBay, Amazon and GunBroker. If your licence includes it, this is a direct read and the cleanest option.

BEST CASE • DAYS, NOT WEEKS

B • Your own eCommerce module

Bravo sell a storefront sync that already delists sold items automatically. If you're paying for it, we switch it on and add the AI layer above it rather than rebuilding it.

POSSIBLY ALREADY YOURS

C • Scheduled export

If the licence has no API, any pawn system can export a file on a timer. Less elegant, identical result — and the enrichment layer doesn't care where the data came from, so we upgrade to A later without redoing the work.

ALWAYS AVAILABLE

Why I think this gap is real: your product SKUs run 257652 — dm, 514744 — tb, 113545 SFconway, 892813 South-SMT — twelve different formats, each ending in a person's initials. Software doesn't vary its own formatting. There are people hand-keying items from the pawn system into Shopify, and the initials show it's at least six of them, each working their own department. If you already pay for the sync, I'll tell you that and we'll scope around it — I'd rather build the layer that adds something than resell you what you own.

Your inputs, not my estimates

Their listed value — if they sell

\$46,764

Read this honestly: the top three are hard — they're just hours x wage. The bottom two are capacity: net profit: freed hours only turn into listings if you use them that way, and listed value is net margin. This is

What stays yours, always

1 The pawn system is never connected

Loans, tickets, IDs, reporting — your regulated core stays exactly as it is. The AI layer reads and writes merchandise listings, nothing else.

2 No customer data goes to the AI

Claude sees photos of merchandise and product text. Never names, numbers, or transactions.

3 Prices are decided by people

The AI suggests a range with its reasoning. The number that goes live is always your appraiser's call.

4 Nothing publishes unread

Listings, texts, review replies — all drafts until a human approves. Enforced by how the systems are built, not by policy.

5 Everything is reversible and everything is yours

The theme rolls back in one click. If we ever part ways, the theme, the categories, and the systems stay with your store.

The rebuild already follows these rules. Every product photo on it is your actual merchandise, pulled from your feed — nothing generated, nothing borrowed, no fake anything.

One thing I'll always do

Tell you when something isn't worth doing. There are AI tools I could sell you for this business that wouldn't earn their keep, and I'd rather keep the account than win the invoice.

90 days, three phases, each one measured

Each phase ends with a number you can check. If a phase doesn't earn the next one, we stop.

WEEKS 1–3

New storefront

- New design installed as your theme
- Catalogue organised (System 2)
- Real collections & jewelry filters
- 5 city pages published
- You preview privately → one-click launch

You'll see: **the new site live on dickspawn.com** and baseline traffic, calls and form fills recorded.

WEEKS 4–8

The typing stops

- Listing Assistant pilot in one department
- Wants-list capture at the counter
- Auto-categorisation on every new item
- Staff training + written runbook

You'll see: **minutes per listing, before vs after**, timed on your real items.

WEEKS 9–12

Reach

- Listing Assistant to all departments
- Arrival alerts through your SMS app
- Ask-the-store widget on the site
- Review replies flowing

You'll see: **items listed per week and online sales** vs the week-3 baseline.

Four things — and only the first one is urgent

1

Shopify collaborator access

Design and products permissions only — no orders, customers, or billing. Shopify's collaborator system means you grant it in two minutes and can revoke it just as fast. **This one key unlocks the entire plan.**

2

One answer about your pawn software

What runs at the counter, and does the licence include online-store connectivity? If you already pay for a sync, I'll build on it rather than around it — and tell you so.

3

A look at your SMS app's plan

If your One AI subscription supports automation, arrival alerts reuse it at no extra cost. If not, the fallback costs about a penny per text.

4

Google Business Profile access

Only needed by Phase 3, for the review responder. Manager access, revocable anytime.

Nothing on this list is a purchase. The plan runs on what you already own, plus AI usage that's included in the pricing on the next slide.

You've already seen the work

I did the homework before the meeting

I pulled your full catalogue and worked out your internal tagging scheme. **HW** means handbags & wallets, not hardware — which is why a naive import would file Louis Vuitton under Tools. I found that because I read your data, not a summary of it.

Local, and staying that way

Myrtle Beach. I can stand at the counter in Surfside and watch how listings actually get made, which is the only way to automate it without breaking it.

The deliverable came first

Most proposals ask you to imagine the result. There's a working 1,576-page site on your real inventory that you can open on your phone right now, before you've paid anything.

Small enough that you get me

No account manager, no offshore hand-off, no ticket queue. You get the person who built it, and you can text him.

START HERE

STEP 1 • PILOT

\$1,500

Two weeks, one workflow, one department.

- ✓ Pick your slowest listing category
- ✓ Build the photo → listing pipeline
- ✓ Time real items, before and after
- ✓ Written findings either way
- ✓ Credited in full toward launch

If the hours don't show up, you get the written findings and we shake hands. No pressure to continue.

STEP 2 • LAUNCH

\$7,500 one-time

Everything in the 90-day plan, phases 1 and 2.

- ✓ New theme live on your Shopify store
- ✓ Catalogue organised, all 5 cities in local search
- ✓ Listing pipeline across departments
- ✓ Lead capture, analytics, call tracking
- ✓ Staff training + written runbook
- ✓ 90 days of support included

The design is largely built — you're paying to install it on your store and operationalise it.

STEP 3 • ONGOING

\$2,400 /month

Optional. Month to month after the first quarter.

- ✓ Pipeline kept running and improved
- ✓ New channels as they're worth adding
- ✓ Review + social queues managed
- ✓ Monthly numbers against baseline
- ✓ You keep everything if you stop

Cancel with 30 days' notice. No lock-in, no licence you can't leave.

Ad-hoc work outside a retainer: \$125/hour. Prices hold for 60 days from the date on the cover.

For comparison: a part-time e-commerce coordinator runs roughly **\$56,000–\$75,000/year** once payroll burden is counted. The ongoing retainer is **\$28,800/year** — and **all AI usage costs are included**: no per-listing fees, no surprise API bills.

— NEXT STEP

Pick one department. Give me two weeks.

We'll time how long it takes to list items today, build the pipeline, then time it again. You'll have a real number — from your floor, your staff, your stock — before you decide anything bigger.
